

# MENINGITIS VIGILANCE FOR AFRICA

Bulletin No. 011

Issued on April 2, 2019

Valid until April 9, 2019

## SUMMARY

- From 10<sup>th</sup> to 11<sup>th</sup> weeks, meningitis cases increased over Central African Republic, Nigeria, Chad, Ghana, Guinea and Mali. A decrease of the occurrence of meningitis was observed over Cameroon and Niger.
- High vigilance is needed for meningitis cases over eastern Niger, central Chad, and Central Sudan.
- Moderate vigilance is required over eastern Mali, southern and central Niger, northern Burkina Faso, Nigeria and Cameroon, and southern Chad.
- Low to no vigilance is needed over the remaining parts of the meningitis belt.

FIGURE 3 – Inventory of meningitis occurrence in Africa during the first eleven weeks of year 2019. Data source : <https://www.who.int/emergencies/diseases/meningitis/meningitis-bulletin-10-2019.pdf?ua=1>

Figure 4 shows the mean relative humidity estimated from NCEP reanalysis during the period from 23 to 30 March 2019. It indicates that very dry atmospheric conditions (relative humidity below 20 %) was observed over eastern Niger, central Chad, and Sudan. Relative humidity between 20 and 40 % prevailed over northern Mali and Mauritania, northern Burkina Faso, Niger, central Nigeria, northern Cameroon, southern Chad and South Sudan. Wet (relative humidity above 40 %) atmospheric conditions were recorded over the Gulf of Guinea countries, Senegal, southern Mali, Mauritania, and Burkina Faso, Ethiopia, Tanzania, Uganda and Burundi.

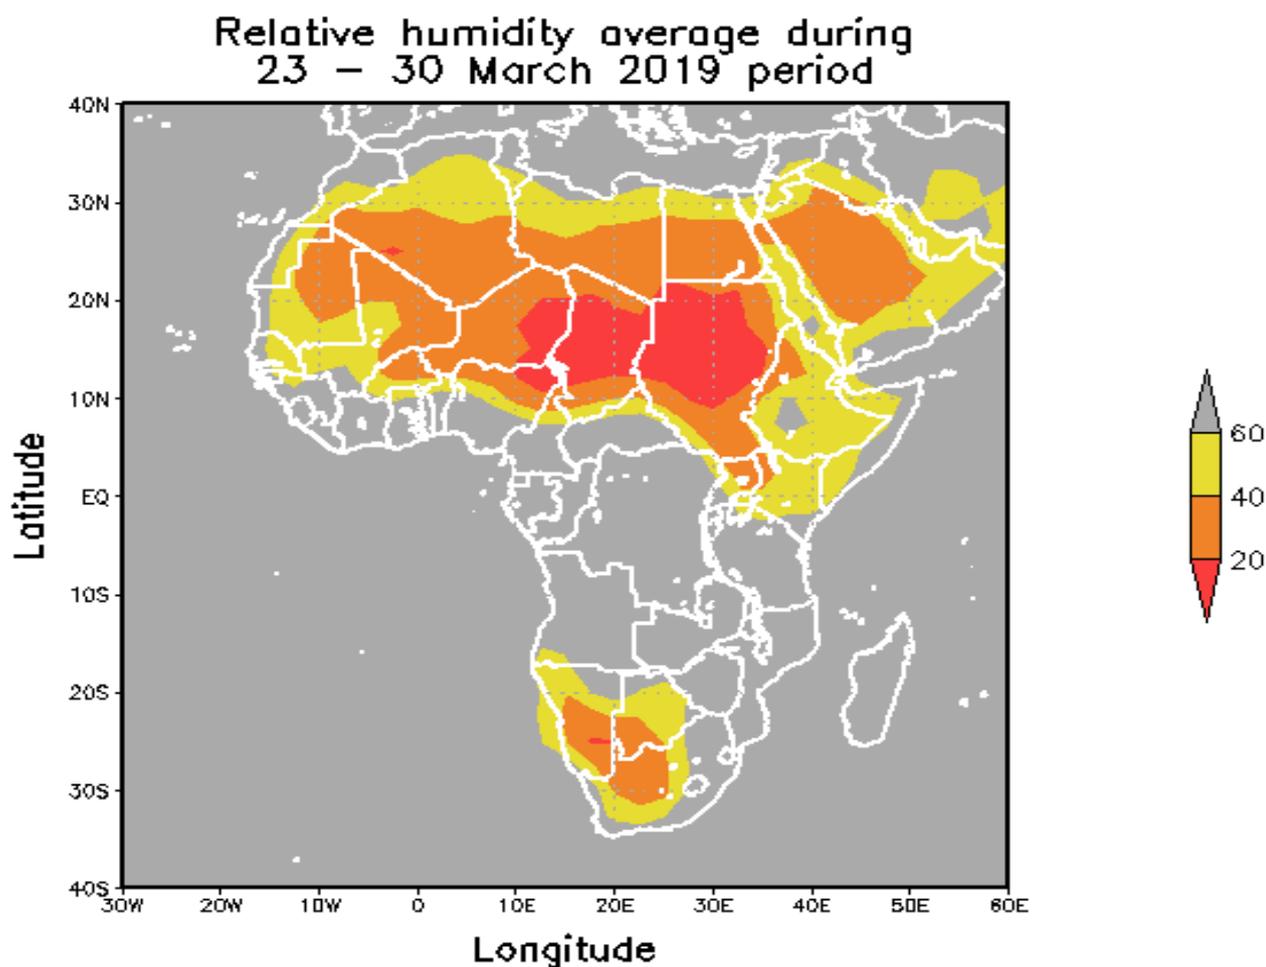

FIGURE 4 – Mean relative humidity (%) for the period from 23 to 30 March 2019 estimated from NCEP reanalysis at 1000 hPa.

Figure 5 gives an example of surface dust concentrations estimated on 30<sup>th</sup> March 2019 at 00 :00 UTC. It indicates that high surface dust concentrations are observed over the West Africa during this night. Highest values of surface dust concentrations prevailed over northern Senegal and southern Mauritania, Central Algeria and Mali, Libya, Egypt northern Niger, southern Sudan, and central Nigeria. Moderate surface dust concentrations are observed over the remaining part of the meningitis.

Figure 6 shows the mean meridional wind speed during the week from 23 to 30 March 2019. It indicates that the south part of the Gulf of Guinea is under the influence of the monsoon flow and the ITD continued its northward migration and attended the south-eastern Senegal, central Mali, northern Burkina Faso, Niamey, and central Nigeria. The Harmattan flow, favoring to increase the meningitis cases was observed over northern eastern part of Mali, Niger, northern Burkina Faso, Nigeria, and Cameroon, Chad, and Sudan.

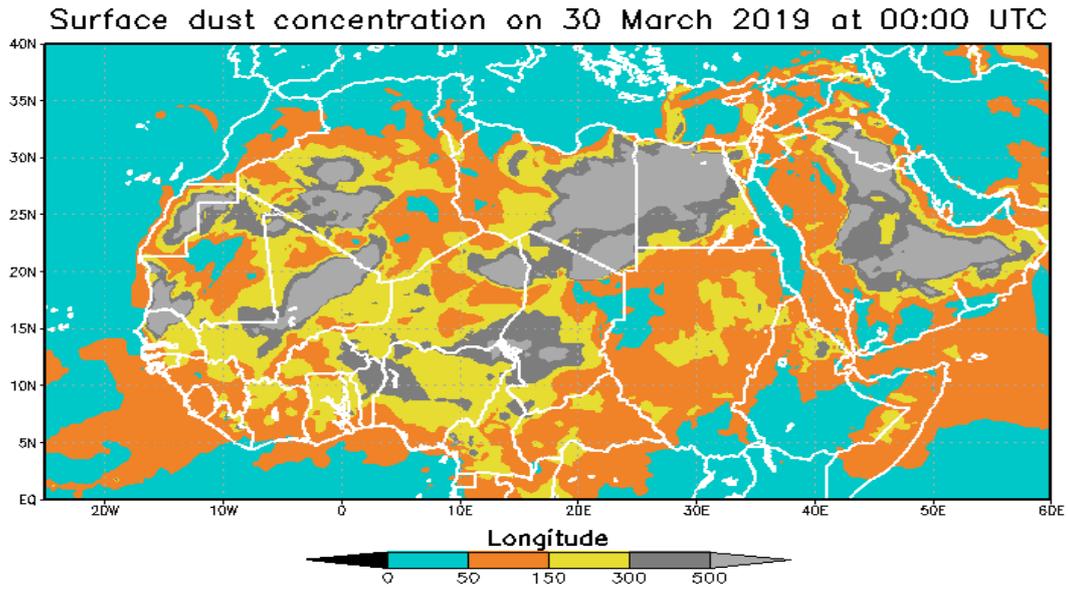

FIGURE 5 – Surface dust concentration ( $\mu\text{g m}^3$ ) estimated on March 30, 2019 at 00 :00 UTC from Goddard Earth Observing Model (GEOS) data.

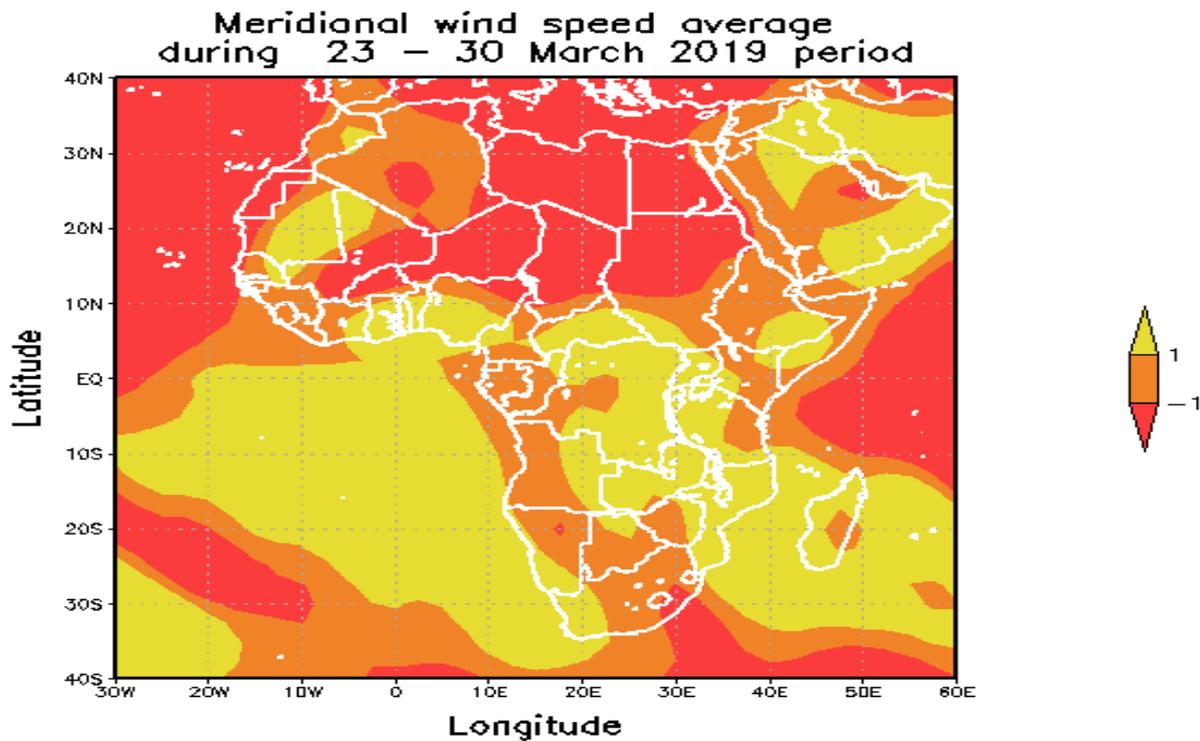

FIGURE 6 – Mean meridional wind speed ( $\text{m s}^{-1}$ ) for the period from 23 to 30 March 2019 estimated from NCEP reanalysis at 1000 hPa.

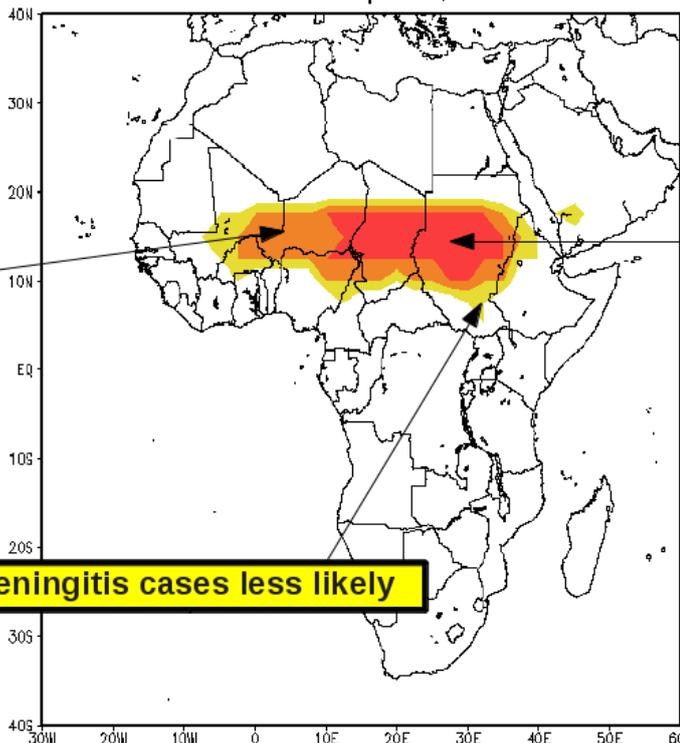

VIGILANCE MAP FOR EMERGENCE OF MENINGITIS IN AFRICA  
ISSUED ON April 2, 2019

<b>HAZARD</b> Dust, wind and relative humidity conditions are favorable for emergence of meningitis cases
<b>POTENTIAL IMPACTS</b> Meningitis cases very likely
<b>MEASURES</b> Activation of meningitis surveillance and systems

**Meningitis cases less likely**

<b>HAZARD</b> Dust, wind and relative humidity conditions are very much favorable for emergence of meningitis cases
<b>POTENTIAL IMPACTS</b> Meningitis cases very likely and epidemics status possible
<b>MEASURES</b> Strengthen meningitis surveillance and systems
